Programming Assignment

Due Wednesday May 4 by 3 pm

Design and implement a pushdown automaton that accepts the language of all arithmetic expressions in a programming language that are syntactically correct. An arithmetic expression is syntactically correct if and only if it is generated by the context-free grammar below.

$G = (V, T, S, P)$, where

$V = \{ \langle \text{expr} \rangle, \langle \text{term} \rangle, \langle \text{factor} \rangle, \langle \text{id} \rangle \}$

$T = \{ x, y, z, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, +, -, *, /, (,) \}$

$\langle \text{expr} \rangle$ is S , the start symbol

P :

$\langle \text{expr} \rangle \rightarrow \langle \text{expr} \rangle + \langle \text{term} \rangle \mid \langle \text{expr} \rangle - \langle \text{term} \rangle \mid \langle \text{term} \rangle$

$\langle \text{term} \rangle \rightarrow \langle \text{term} \rangle * \langle \text{factor} \rangle \mid \langle \text{term} \rangle / \langle \text{factor} \rangle \mid \langle \text{factor} \rangle$

$\langle \text{factor} \rangle \rightarrow \langle \text{id} \rangle \mid \langle \text{dig} \rangle \mid (\langle \text{expr} \rangle)$

$\langle \text{id} \rangle \rightarrow \langle \text{letter} \rangle \mid \langle \text{id} \rangle \langle \text{letter} \rangle \mid \langle \text{id} \rangle \langle \text{digit} \rangle \mid \langle \text{digit} \rangle$

$\langle \text{letter} \rangle \rightarrow x \mid y \mid z$

$\langle \text{digit} \rangle \rightarrow \langle \text{digit} \rangle \langle \text{digits} \rangle \mid 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9$

$\langle \text{digits} \rangle \rightarrow 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9$

1. This is a two-team student assignment.
2. Programming languages you can choose from: C, C++, Java. Your programs must run on empress.
3. For input: expressions such as:

$(x * y / (3 + z)),$

$3 + 4 * 5,$

$x * x * x$

Your program must display:

"Expression is syntactically correct"

For input expressions such as:

`z) (3 ** y`

`f * x)`

`/ 5 y`

`(((z + 3 - x))`

Your program must display:

"Expression is not an arithmetic expression"

4. You can prompt the user to input an expression or you can prompt the user to type the name of a file. If you do the latter name your file **expressions.txt**.
5. Upload the files with 1) your source code, 2) executable/runnable code, and 3) a README file where you describe how to compile and run your program. Name your files using your *lastnames*.
6. **Make sure that you start early to meet the deadline.** No hardcopies will be given credit. No emailed files will be given credit. Programs that cannot be compiled/run on empress will not be given credit.
